Evidence before outreach. Human control throughout.

GM criteria → sourced shortlist → contact and industry confirmation → approved reference or no reference → reviewed draft → manual send → status monitoring.

Mandatory eligibility is separate from preferences. Fit is separate from evidence confidence. Source material never authorizes workflow actions.

Actual Chromium capture of the application using explicit synthetic evaluation data. Render hosting is prepared, not deployed.

Traceable decisions

Source passages, approved claims, draft versions, final character count and actual manual-send time remain distinct.

Next.js + server-side OpenAI Responses + persistent PGlite + Gmail test alerts. Prospect outreach is never automatically sent.

MEASURED EVALUATION · 2 / 2

One real failure. One documented improvement.

Acceptance fixtures

9 → 10 / 10

Before and after the same claim-guard test

Regression / browser

64 / 16

Different checks; not a factual-accuracy score

Local hosted checks

18 / 18

Roles, restart persistence and scheduler heartbeat

Before: unsupported claim accepted

“Our customers saved fifty percent with EVOX.”

No approved customer evidence. Digits were checked; written numbers bypassed the validator.

After: the identical input is rejected

Written-number metrics and added customer outcomes are checked beyond the exact approved claim.

Before/after inputs, actual results and regression tests are retained. Human factual review is still required.

What is still unverified

Live AI	2 real requests → HTTP 401
Gmail	Missing configuration; no sent email
Render	Prepared; no remote deployment

No prospect accuracy, delivered-email, time-saving or conversion claim is made. Ten curated fixture passes do not establish live research quality.

Sources: evaluation JSON, qualitative customer-story review and actual UI screenshots. Run date: 23 October 2026.

Next step: create the Render service, configure valid provider credentials, then verify remote persistence, restrictions, one live AI request and one scheduled test alert.
